

In this project I use only one class with all methods that required to make the machine working, also I use HashMap to identify the 25 item of snack and named the column (1,2,3,4,5) and the row (1,2,3,4,5) we can go deeper for this project and create other classes for card bank method which will need bank-account class and user class etc

looking forward to hear from you and if there is anything you want to ask about me I will be more than happy.
